Connect, Protect & Control Services in the Cloud

Cloud computing is transforming how enterprises:

- Scale up computing power
- Maximize storage capacity
- Consume mission-critical software applications

While many organizations recognize the potential value of software as a service (SaaS) and infrastructure as a service (IaaS), they also recognize that a number of concerns around data security, application performance and availability need to be resolved before widespread adoption can occur.

Layer 7 Solutions for Cloud Integration

Layer 7 is helping eliminate barriers to cloud adoption by allowing enterprises to control how they consume SaaS applications (like Salesforce) and cloud infrastructure (like Amazon Web Services). By implementing Layer 7 solutions, enterprise architects can connect and protect the enterprise in the cloud.

Layer 7 delivers Cloud Integration solutions that leverage the company's award-winning Gateway technologies to address the security and connectivity issues associated with enterprise adoption of public and private clouds. Layer 7's Cloud Integration solutions are built upon industry-leading technologies like:

- **CloudSpan CloudConnect Gateway**
Simplify Single Sign-On (SSO) and integration to SaaS applications and other cloud-based services; secure and manage service APIs published to the cloud
- **Enterprise Service Manager**
Gain full control over and visibility into the service lifecycle of applications run in the cloud
- **Policy SDK**
Extend the functionality of Layer 7's products to handle specific protocols, unique data types and integration with custom products

Layer 7's Cloud Integration products are available in a wide range of formats:

Software

Virtual (VMware)

Amazon Machine Image

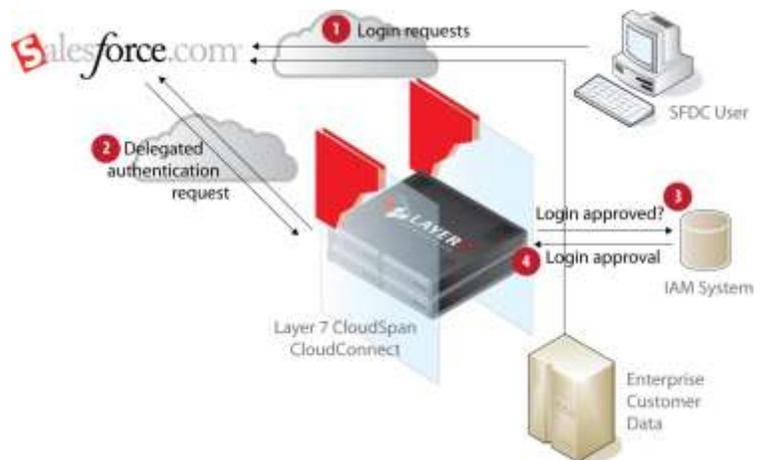

Hardware

SSO & Integration for Salesforce

Challenge: This leading financial services organization needed to eliminate the security risk associated with placing enterprise passwords in Salesforce and integrate on-premise customer data into the Salesforce system.

Solution: CloudConnect utilized existing enterprise identity and access management systems in order to provide SSO while facilitating secure Web services integration with internal systems.

Results: Because users only had to manage a single login/password for all systems and administrators only had to manage a single identity repository, security was enhanced and administration costs were lowered.

Cloud Security for Government

Challenge: This US federal agency needed to implement a major online initiative within a very restricted timeframe. Cloud computing presented the solution to this scalability challenge but also raised serious security concerns.

Solution: CloudConnect was used to monitor and measure the IaaS providers' security controls to ensure they were being properly implemented, in line with the government's certification and accreditation processes.

Results: The agency was able to create a secure and stable online system within 30 days. The initiative was considered both a great success and a significant move into the cloud for the federal government.

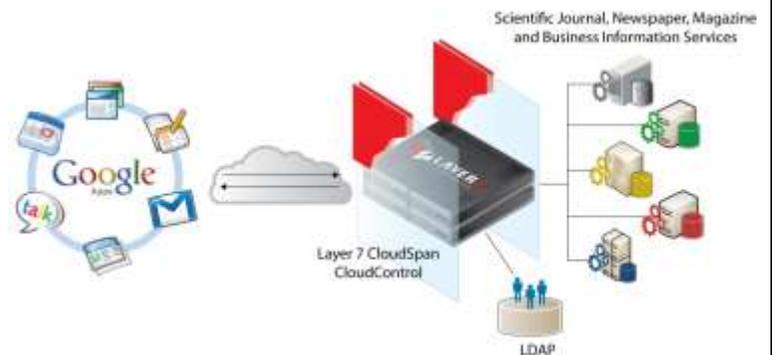

Online Data Syndication with Google Apps

Challenge: This major online data publisher needed to create a system that would allow its customers and partners to use Google Apps in order to access multiple existing information services.

Solution: A Layer 7 Gateway was used to secure cloud APIs, authorize users, apply rate limiting to user contracts, convert REST queries to SOAP and provide API aggregation, versioning and orchestration.

Results: The company was able to implement business logic in policy, decreasing maintenance costs while speeding and simplifying information gathering for customers and partners.
