Business Challenges

Core business applications are critical to the success of the business today more than ever. However, developing and maintaining them can be a challenge. These business systems must support an organization's core business strategy, and they must be flexible enough to adapt to change. This can be difficult, especially when mergers, acquisitions and partnerships require that key data must integrate across multiple platforms and computing environments.

The IBM i remains the server and platform of choice for thousands of organizations around the world. Keys to its continued use are integrated environment, low maintenance cost, high degree of security, high customer satisfaction ratings and ease of use. While IBM i skills are perceived to be diminishing, the need for developers who can work with the platform persists. Organizations continue to seek IBM i experts and CA 2E developers rank among the world’s best in this platform.

Solution Overview

CA 2E is a leading Rapid Application Development tool for the IBM i. CA 2E provides models, templates and generators, helping organizations increase the productivity of their application developers. The integrated modeling environment of CA 2E helps provide a development methodology that can be easily understood by both business and technical staff. With decades of delivering value to organizations, CA 2E provides stability and reliability in helping the business to curb ancillary costs associated with project timeline changes, resource allocation and training requirements.
Critical Differentiators

CA 2E generates 100% of the code required for applications for both client and server, and database objects for IBM i. Developers are not required to know low-level details of the underlying programming languages or database access implementation. Impact analysis and application documentation are embedded, which allows modifications to be easily identified. Multiple developers can work on one project simultaneously, providing marked productivity increases. Modular application development allows new applications to use components created for existing applications. This reduces the time to develop and test CA 2E applications. In addition, it serves as a base for legacy modernization projects including web enablement, transitioning to additional distributed platforms or creating business logic components for use in additional environments.

Related Products/Solutions

**CA Plex** extends CA 2E applications into a number of GUI-based environments through migration or co-existence with this dynamic model-based development environment.

Supported Environments
