

Integrated Windows Authentication for CA Identity Manager

What It Does

CA Identity Manager comes with an out of box authentication module that authenticates the user against the directory configured for the environment. However, if the user needs to be authenticated against Integrated Windows Authentication (IWA), this Packaged Work Product is designed to facilitate the authentication.

Benefits That Deliver Value

Integrated Windows Authentication for CA Identity Manager provides:

- Centralized Single Sign-On authentication via Integrated Windows Authentication
- Whitelisted Domains to support
- Secure, Reliable, and Scalable
- Simplicity of support

How It Works

The Packaged Work Product consists of two primary features:

Authenticating the User

Authentication of the user is based upon Microsoft's Internet Information Services (IIS) authentication. A positive authentication is trusted and tokenized for disambiguation of the user within CA Identity Manager.

Disambiguation of the User

The Component queries the CA Identity Manager User Repository to find the user. If the user is not found, the Component will return an error. If the user is found, then the user is authenticated.

Technical Prerequisites

A list of technical prerequisites for this packaged work product can be found at [CA Support online](#). This is a central repository that will help you identify CA Technologies product compatibility with operating systems, other third-party software products, as well as with certification standards and regulations.
